PROFESSIONAL SUMMARY

Senior DevOps and Platform Engineer with over 10 years operating mission-critical, highly available infrastructure in production, and leading a small DevOps and security engineering team. Specialised in multi-datacenter active/active platforms on Kubernetes (RKE2 and Kubespray), distributed SQL (CockroachDB) and PostgreSQL, backed by a fully self-hosted observability and security stack. Equally at home in code as in operations — builds production tooling and services in Go and Python (gRPC, ClickHouse) and automates infrastructure end-to-end with Ansible, Terraform, and Pulumi. Owns the full stack from bare-metal, Linux networking, and VMware through container orchestration, SRE practice, and DevSecOps.

CORE SKILLS & TECHNOLOGIES

Orchestration & Containers: Kubernetes (RKE2 & Kubespray), Docker, Podman, Helm

Databases & Storage: CockroachDB, PostgreSQL, ClickHouse, MongoDB, Redis, MinIO (S3-compatible)

Observability & Alerting: Prometheus, Thanos, Grafana, Loki, Alertmanager, Elasticsearch / Kibana, Splunk

Security & DevSecOps: Wazuh, FortiGate, TLS / PKI, penetration testing, vulnerability management

IaC & Automation: Ansible (advanced), Ansible AWX, Terraform, Pulumi, Jinja2

CI/CD & Artifacts: GitLab CI/CD, Jenkins, Harbor, Nexus, NetBox (IPAM)

Linux Networking: Policy / static routing, iptables, ipset, custom routing tooling, site-to-site VPN (WireGuard / GRE / IPsec), Cisco Nexus

Virtualisation & Compute: VMware ESXi / vSphere, bare-metal, NVIDIA GPU (LLM inference)

Programming: Go, Python, gRPC, Bash / Shell scripting

Operating Systems: Linux (Ubuntu, Rocky / RHEL)

PROFESSIONAL EXPERIENCE

Jibit

Senior DevOps & Platform Engineer

Oct 2021 – Present

Tehran, Iran

Fintech building payment and financial-infrastructure services.

- Lead and mentor a 2–4 person infrastructure team of DevOps and security engineers — covering hiring, mentoring, and a KPI-based performance-management system — while staying hands-on across the platform.
- Design and operate a **three-site active/active platform across 3 geographically distributed datacenters**, providing high availability for mission-critical payment services.
- Run production Kubernetes (RKE2 and Kubespray) on bare-metal and VMware across **[# nodes]**, handling cluster lifecycle, LVM storage provisioning, and node-level operations.
- Operate CockroachDB as the distributed-SQL backbone — multi-region clusters, certificate lifecycle, and batched data migrations — alongside PostgreSQL, MinIO object storage, MongoDB, and Redis.
- Built and maintain a fully self-hosted observability and alerting stack (Prometheus / Thanos, Grafana, Loki, Alertmanager, Elasticsearch / Kibana) and security monitoring with Wazuh and Splunk, replacing legacy Zabbix / Graylog tooling.
- Automate the estate end-to-end with Ansible / AWX, Terraform, and Pulumi; standardised IPAM and configuration management with NetBox, and built custom Linux networking tooling (policy-based routing, iptables, and ipset automation across hosts).
- Lead DevSecOps initiatives: security validation, AI-assisted penetration testing (network, web, and Kubernetes), and vulnerability-assessment maturity.
- Delivered a 1G → 25G core network migration (Cisco Nexus 9300) using a zero-downtime, colocated-rack approach; manage CI/CD and the registry layer (GitLab, Harbor, Nexus) across all sites.

Radar Faratech Hooshmand

DevOps Engineer

Oct 2020 – Oct 2021

Tehran, Iran

Location-data infrastructure startup.

- Introduced and operated Kubernetes orchestration in production for the company's location-data platform.
- Built git-based CI/CD pipelines with webhook automation and autoscaling; managed cloud and on-prem services including VPNs, proxies, caching, CDN, backups, and central logging.

- Administered Linux production VMs and VMware hypervisors; ran monitoring (Grafana) and centralised logging.

Part Software Group (PartDP)

DevOps Engineer

Fintech software company.

Dec 2015 – Oct 2020

Mashhad, Iran

- Transitioned from systems administration into DevOps, owning application deployment and continuous-delivery pipelines in production.
- Managed Linux production workloads and VMware virtualisation; implemented monitoring (Zabbix, Grafana) and centralised logging (Graylog).
- Administered networking, site-to-site tunnels, and mixed Windows / Active Directory / Exchange environments.

Earlier Experience — System Administrator

Farab (MURL) & Mashhad Washer Co.

2013 – 2015

Mashhad, Iran

- Windows Server, Active Directory, Exchange, VoIP, and site-to-site network administration in mixed corporate environments.

SELECTED PROJECTS & TOOLS

Chaparkhoneh — Public service status page — a concurrent gRPC service backed by a ClickHouse store for recording and querying service-health data.

Iris — Alerting and notification platform for the Alertmanager + Grafana stack, with delivery retries and a unified dashboard aggregating all alerts.

FinOps cost-allocation platform — Go + React platform attributing bare-metal infrastructure cost across compute, memory, storage, object storage, and Kubernetes resource requests, with multi-currency reporting.

Linux routing & firewall tooling — Custom tools for policy-based routing and iptables / ipset automation across Linux hosts.

LANGUAGES

Persian — Native **English** — Professional working proficiency
